

Kuggfri for Materialteknik

Every card is now in rotation and waiting for your review. The service opens to students **once every card has been reviewed**. Today we agree on who reviews what, by when, and the launch date.

● Cards

405

in 14 topics, all in rotation

● Flagged

103

by Kuggfri's source check

● Reviewed

0

the review starts after today

● Review time

about 7 h

5 h for Johan, 2 h for Roland

Agenda

- | | | |
|---|--|--------|
| 1 | Where we are
The course content since the first version: 144 cards became 405, every card checked against the course material, with sources. | 5 min |
| 2 | Demo: the student's view
Home page, today's session, a card, the summary and My statistics. | 10 min |
| 3 | Demo: the review
The review page, one card at a time, the four decisions, flags, and English as a setting on the account. | 10 min |
| 4 | Review plan and launch date
Who reviews which topics, by when, and the date the course opens to students. | 15 min |
| 5 | Decisions and open questions
The exam date, values that differ between sources, and the questions on page 3. | 15 min |
| 6 | Next steps
Who does what after the meeting. | 5 min |

● Demo order

- Student view on kuggfri.com, with Alvin's own study history.
- The review on kuggfri.com, as an examiner sees it, in Swedish and English.
- The course overview locally, with **simulated** students, to show the statistics examiners will get.

● Handed out today

- Review guide in Swedish (Johan) and English (Roland), three pages each.
- Student guide, eight pages, sent with the launch announcement.
- The link to the service, sent by Alvin by email.

Review plan

Each examiner reviews their own part. A card is done when it is approved or removed from rotation, and a flag is done when it is resolved.

● Johan Ahlström, metals

297 cards

topics 1–11, of which 87 flagged. About 5 hours.

● Roland Kádár, polymers

108 cards

topics 12–14, of which 16 flagged, all with English notes. About 2 hours.

TOPIC	CARDS	FLAGGED	REVIEWER
1 Material groups and properties	24	5	Johan
2 The materials selection process	27	6	Johan
3 Crystal structure	28	6	Johan
4 Phase diagrams and microstructure	45	14	Johan
5 Stiffness and elastic deformation	21	5	Johan
6 Plasticity, dislocations and hardening	24	3	Johan
7 Fracture and fatigue	30	10	Johan
8 Thermal properties, diffusion and creep	29	15	Johan
9 Steel, heat treatment and processing	36	12	Johan
10 Non-ferrous metals	17	4	Johan
11 Sustainability and recycling	16	7	Johan
12 Structure of Polymers	37	7	Roland
13 Polymer melt rheology and processing	44	4	Roland
14 Mechanical properties of polymers	27	5	Roland

Proposed timeline, to decide today

Today, 2 Oct Review guides and the link go out. Both examiners create their accounts.

By Fri 9 Oct Johan and Roland have reviewed their topics. Alvin fixes flagged cards within a day.

Mon 12 Oct Last check, then the course opens to students and the student guide is sent out.

The dates are a proposal. The service opens only when the review shows 0 cards left.

● What makes the review quick

- One card at a time, with keyboard shortcuts: G approves.
- Every decision saves at once; it can be split over several sittings.
- A flag with a short note is enough: Alvin makes the change and it comes back for approval.

Decisions and open questions

The answers settle many flags at once and let the review go faster.

QUESTION	WHY IT MATTERS
1 The exam date for MTT085	The schedule plans towards it: every card in time, nothing pushed past the exam, a final review the last days.
2 Which values should the course use?	The sources differ: 723 or 727 °C, 0.8 or 0.77 % C for the eutectoid point, and 910, 912 or 913 °C. One decision settles 6 flags and all Fe–C cards.
3 Cards that follow old exam questions closely: keep or rewrite?	6 flags ask whether a card is too close to an exam question or its suggested solution.
4 Is the Boltzmann superposition principle part of this year's course? (Roland)	It is not in the reading instructions for PM 6 in 2024 and 2025. Two cards depend on it.
5 May figures from the course books (Ashby, Osswald) be used in cards?	Otherwise only our own redrawn diagrams.
6 The weekly summary by email is on by default: keep it?	Monday mornings to both examiners: active students, hardest topics, tricky questions and error reports. Anonymous, in each examiner's chosen language. Can be turned off under Account.

Found in the 2025 material on Canvas

The same errors were corrected in the cards. Should the slides be updated too?

- Lecture 9 p. 7: the K1c condition.
- Lecture 12 p. 22: tempered martensite.
- Lecture 13 p. 13: titanium as the only biocompatible metal.
- GLU 5-8 p. 15: about 30 % primary ferrite, where the lever rule gives about 60 %.

For Roland

- Errors in old suggested solutions: the pressure build-up zone in the extruder (IMS085 2023-10-25 p. 6) and "ejection unit" (2021).
- The order of the necking stages: Lecture 21 p. 14 versus L6 p. 10.
- Swedish term choices for metering zone, die swell and holding pressure.

32 corrected originals

Original cards from earlier cohorts that the source check corrected. Each can be approved or restored to the original wording.

Your own feedback

On the content, the study modes and the review. Anything you want changed before launch.

After the meeting

Alvin makes the agreed changes, sends the guides and the link, and follows the review until 0 cards are left.
